# A bifurcation of multiple eigenvalues and eigenfunctions for boundary value problems in a domain with a small hole 

By Nguyen Minh Tri

Dedicated to Professor Sigeru Mizohata

#### Abstract

In the present paper we study the asymptotic expansion of the multiple eigenvalues and eigenfunctions for boundary value problems in a domain with a small hole. We prove the bifurcation of these eigenvalues under certain conditions.

## 1. Introduction and main results

The purpose of this article is to study asymptotic formula of multiple eigenvalues and eigenfunctions for boundary value problems in a domain with a small hole. Let $\Omega$ be a bounded domain with smooth boundary in $\mathbb{R}^{3}$ and $\{0\} \in \Omega$. Let $B_{1}$ be the unit ball in $\mathbb{R}^{3}$. We consider the following problem :

$$
\begin{align*}
& \Delta u(x, \varepsilon)+\lambda(\varepsilon) u(x, \varepsilon)=0, \quad \text { in } \Omega_{\varepsilon}=\Omega \backslash \varepsilon B_{1}  \tag{1}\\
& \left.u(x, \varepsilon)\right|_{\partial \Omega_{\varepsilon}}=0 \tag{2}
\end{align*}
$$

All the eigenvalues of (1)-(2) may be put in non-decreasing order $0<$ $\lambda_{1}(\varepsilon)<\lambda_{2}(\varepsilon) \leq \lambda_{3}(\varepsilon) \cdots$. The first eigenvalue is always simple (see [1]). The eigenvalue from $\lambda_{2}(\varepsilon)$ may be multiple. We shall study the behavior of

[^0]the functions $\lambda_{n}(\varepsilon)$ when $\varepsilon \rightarrow 0(n \geq 2)$. The problem (1)-(2) is connected closely with following one in the limit case :
\[

$$
\begin{align*}
& \Delta u(x)+\lambda u(x)=0, \quad \text { in } \Omega  \tag{3}\\
& \left.u(x)\right|_{\partial \Omega}=0 . \tag{4}
\end{align*}
$$
\]

All the eigenvalues of (3)-(4) may be also put in non-decreasing order $0<\lambda_{1}<\lambda_{2} \leq \lambda_{3} \ldots$. It is well-known that $\lim _{\varepsilon \rightarrow 0} \lambda_{j}(\varepsilon)=\lambda_{j}$ (see[2]). Let $\lambda_{j}$ be a simple eigenvalue. In the work [2], [3] Ozawa S. obtained the statement :

$$
\lambda_{j}(\varepsilon)=\lambda_{j}+4 \pi u_{j}^{2}(0) \varepsilon+C_{j} \varepsilon^{2}+0\left(\varepsilon^{5 / 2}\right) \quad(\varepsilon \rightarrow 0)
$$

where $u_{j}(x)$ is the normed eigenfunction corresponding to $\lambda_{j}$ and where $C_{j}$ is a constant explicitly calculated.

We shall find a full asymptotic formula of $\lambda_{j}(\varepsilon)$ in a form $\lambda_{j}(\varepsilon)=$ $\sum_{i=0}^{\infty} \lambda_{j}^{<i>} \varepsilon^{i}$ and corresponding eigenfunctions $u_{j}(x, \varepsilon)$ in a form :

$$
u_{j}(x, \varepsilon)=\sum_{k=0}^{\infty}\left(m_{k j}(x)+n_{k j}(\xi)\right) \varepsilon^{k}
$$

where $\xi=x \varepsilon^{-1}$. The functions $m_{k j}(x)$ and $n_{k j}(\xi)$ have asymptotic expansions

$$
\begin{equation*}
m_{k j}(x)=\sum_{i=0}^{N} m_{k j}^{<i>}(\theta) \cdot|X|^{i}+\tilde{m}_{k j}^{<N>}(x) \tag{5}
\end{equation*}
$$

$$
\begin{equation*}
n_{k j}(\xi)=\sum_{i=1}^{N} n_{k j}^{<i>}(\theta) \cdot|\xi|^{-i}+\tilde{n}_{k j}^{<N>}(\xi) \tag{6}
\end{equation*}
$$

where $\left|D_{x}^{\alpha} \tilde{m}_{k j}^{<N>}(x)\right| \leq C_{N, k, \alpha, j}|x|^{-N+1-|\alpha|}$

$$
\left|D_{\xi}^{\alpha} \tilde{n}_{k j}^{<N>}(\xi)\right| \leq C_{N, k, \alpha, j}|\xi|^{-N-1-|\alpha|}
$$

$\theta=\left(\theta_{1}, \theta_{2}\right)$ denotes coordinates on $S^{2}$ and $m_{k j}^{<i>}(\theta), n_{k j}^{<i>}(\theta)$ are smooth functions on $S^{2}$. In the paper [4] Mazia V.G., Nazarov S.A.,
B.A.Plamenevskii found a full asymptotic formula for simple eigenvalues. Let $\lambda_{j}$ be a simple eigenvalue of the problem (3)-(4). Then we have the following expansion for $\lambda_{j}(\varepsilon)$ :

$$
\lambda_{j}(\varepsilon)=\lambda_{j}+4 \pi u_{j}^{2}(0) \varepsilon+\lambda_{j}^{<2>} \varepsilon^{2}+\ldots+\lambda_{j}^{<M>} \varepsilon^{M}+0\left(\varepsilon^{M+1}\right)
$$

where $M$ is any positive integer number. In the article [5] the author obtained the

Theorem. Let $\lambda_{j}$ be a double eigenvalue of (3)-(4). It corresponds two orthonormal eigenfunctions $u_{j}(x), u_{j+1}(x)$. Assume that $u_{j}^{2}(0)+u_{j+1}^{2}(0)>$ 0 , then we have a formula for the eigenvalues $\lambda_{j}(\varepsilon) \leq \lambda_{j+1}(\varepsilon)$ (respectively)

$$
\lambda_{j+k}(\varepsilon)=\sum_{i=0}^{M} \lambda_{j+k}^{<i>} \varepsilon^{i}+0\left(\varepsilon^{M+1}\right) \quad k=0,1
$$

Furthemore $\lambda_{j}^{<0>}=\lambda_{j+1}^{<0>}=\lambda_{j}, \lambda_{j}^{<1>}=0, \lambda_{j+1}^{<1>}=4 \pi\left(u_{j}^{2}(0)+u_{j+1}^{2}(0)\right)$.
Remark. It is easy to see that the sum $\left(u_{j}^{2}(0)+u_{j+1}^{2}(0)\right)$ is invariant under any orthogonal transformations in the plane $\left(u_{j}, u_{j+1}\right)$.

Corollary. Assume that $\left(u_{j}^{2}(0)+u_{j+1}^{2}(0)\right)>0$. Then the eigenvalues $\lambda_{j}(\varepsilon), \lambda_{j+1}(\varepsilon)$ are simple and different as $\varepsilon \rightarrow 0$.

In the present paper the author continue the studies in [2]-[5]. We shall consider the case when $\lambda_{j}$ is a double or triple eigenvalues. Let $\lambda_{j}$ be a double and $u_{j}(0)=u_{j+1}(0)=0$. We expand $u_{j}(x), u_{j+1}(x)$ in series :

$$
u_{j+k}(x)=u_{j+k}^{<1>}(\theta) r+u_{j+k}^{<2>}(\theta) r^{2}+\ldots+u_{j+k}^{<M>}(\theta) r^{M}+0\left(r^{M+1}\right) \quad(r \rightarrow 0)
$$

where $k=0,1$ and $r=|x|$.
One can write the Laplace operator in the spherical coordinates

$$
\Delta=\frac{\partial^{2}}{\partial r^{2}}+\frac{2}{r} \quad \frac{\partial}{\partial r}+\frac{1}{r^{2}} \Delta_{S^{2}}
$$

where- $\Delta_{S^{2}}$ is the Laplace - Beltrami operator on sphere. Since the functions $u_{j}(x), u_{j+1}(x)$ are the eigenfunctions, it follows that $u_{j}^{<1>}(\theta), u_{j+1}^{<1>}(\theta)$ satisfy the equations (see [6]) :

$$
\Delta_{S^{2}} u_{j+k}^{<1>}(\theta)+2 u_{j+k}^{<1>}(\theta)=0 \quad(k=0,1)
$$

Therefore we have the indentities

$$
u_{j+k}^{<1>}(\theta)=a_{j+k}^{<1>} A_{1}(\theta)+a_{j+k}^{<2>} A_{2}(\theta)+a_{j+k}^{<3>} A_{3}(\theta) \quad(k=0,1)
$$

where $A_{1}(\theta), A_{2}(\theta), A_{3}(\theta)$ denote orthonormal eigenfunctions of $\Delta_{S^{2}}$ with the eigenvalue 2.

Theorem 1. Let $\lambda_{j}$ be a double eigenvalue and $u_{j}(0)=u_{j+1}(0)=0$. Assume that

$$
T_{j}:=\left|\sum_{i=1}^{3}\left[a_{j}^{(i)}\right]^{2}-\sum_{i=1}^{3}\left[a_{j+1}^{(i)}\right]^{2}\right|+\left|\sum_{i=1}^{3} a_{j}^{(i)} a_{j+1}^{(i)}\right| \neq 0
$$

Then we have the expansions for $\lambda_{j}(\varepsilon) \leq \lambda_{j+1}(\varepsilon) \quad$ (resp.)
(7) $\lambda_{j+k}(\varepsilon)=\lambda_{j}+\lambda_{j+k}^{<3>} \varepsilon^{3}+\lambda_{j+k}^{<4>} \varepsilon^{4}+\cdots+\lambda_{j+k}^{<M>} \varepsilon^{M}+0\left(\varepsilon^{M+1}\right) \quad(\varepsilon \rightarrow 0)$ where $k=0,1$ and $\lambda_{j}^{<3>}<\lambda_{j+1}^{<3>}$.

Corollary 1. Assume that $u_{j}(0)=u_{j+1}(0)=0, T_{j} \neq 0$, then $\lambda_{j}(\varepsilon)$, $\lambda_{j+1}(\varepsilon)$ are simple and different as $\varepsilon \rightarrow 0$.

Remark. The condition $T_{j} \neq 0$ is equivalent to the following condition : the matrix

$$
\left(\begin{array}{ll}
\left(u_{j}^{<1>}(\theta), u_{j}^{<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} & \left(u_{j}^{<1>}(\theta), u_{j+1}^{<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} \\
\left(u_{j}^{<1>}(\theta), u_{j+1}^{<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} & \left(u_{j+1}^{<1>}(\theta), u_{j+1}^{<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)}
\end{array}\right)=: M
$$

has two different eigenvalues. In the future it is easy to see that $3^{-1} \lambda_{j}^{<3>}$, $3^{-1} \lambda_{j+1}^{<3>}$ are the eigenvalues of the matrix $M$.

Now let $\lambda_{j}$ are a triple eigenvalue of the problems (3)-(4). It corresponds three orthonormal functions $u_{j}(x), u_{j+1}(x), u_{j+2}(x)$. Assume that
$u_{j}^{2}(0)+u_{j+1}^{2}(0)+u_{j+2}^{2}(0) \neq 0$. Then we can always choose 3 functions $u_{j}^{*}(x), u_{j+1}^{*}(x), u_{j+2}^{*}(x)$ in the plane $\left(u_{j}(x), u_{j+1}(x), u_{j+2}(x)\right)$ such that

$$
\begin{gathered}
u_{j+k}^{*}(x)=u_{j+k}^{*<1>}(\theta)|x|+u_{j+k}^{*<2>}(\theta)|x|^{2}+\cdots+u_{j+k}^{*<M>}(\theta)|x|^{M}+0\left(|x|^{M+1}\right) \\
\left(u_{j+i}^{*}(x), u_{j+k}^{*}(x)\right)_{L^{2}(\Omega)}=\delta_{i k} \quad(i, k=0,1,2), u_{j}^{*}(0)=u_{j+1}^{*}(0)=0 \\
u_{j+2}^{* 2}(0)=u_{j}^{2}(0)+u_{j+1}^{2}(0)+u_{j+2}^{2}(0)
\end{gathered}
$$

TheOrem 2. Let $\lambda_{j}$ be a triple eigenvalue of (3)-(4). Assume that $u_{j+2}^{*}(0) \neq 0$ and the matrix

$$
\left(\begin{array}{ll}
\left(u_{j}^{*<1>}(\theta), u_{j}^{*<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} & \left(u_{j}^{*<1>}(\theta), u_{j+1}^{*<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} \\
\left(u_{j}^{*<1>}(\theta), u_{j+1}^{*<1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)} & \left(u_{j+1}^{*<1>}(\theta), u_{j+1}^{* * 1>}(\theta)\right)_{L^{2}\left(\partial B_{1}\right)}
\end{array}\right)=: M^{*}
$$

has two different eigenvalues. Then we have the asymptotic formula for $\lambda_{j}(\varepsilon) \leq \lambda_{j+1}(\varepsilon) \leq \lambda_{j+2}(\varepsilon)$

$$
\begin{aligned}
& \lambda_{j+k}(\varepsilon)=\lambda_{j}+\lambda_{j+k}^{<3>} \varepsilon^{3}+\lambda_{j+k}^{<4>} \varepsilon^{4}+\cdots+\lambda_{j+k}^{<M>} \varepsilon^{M}+0\left(\varepsilon^{M+1}\right) \quad(\varepsilon \rightarrow 0) \\
& \lambda_{j+2}(\varepsilon)=\lambda_{j}+4 \pi\left[u_{j+2}^{*}(0)\right]^{2} \varepsilon+\lambda_{j+2}^{<2>} \varepsilon^{2}+\cdots+\lambda_{j+2}^{<M>} \varepsilon^{M}+0\left(\varepsilon^{M+1}\right)
\end{aligned}
$$

$$
(\varepsilon \rightarrow 0)
$$

where $k=0,1$, and $\lambda_{j}^{<3>}<\lambda_{j+1}^{<3>}$.
Corollary 2. If $u_{j+2}^{*}(0) \neq 0$ and the matrix $M^{*}$ has two different eigenvalues, then the eigenvalues $\lambda_{j}(\varepsilon), \lambda_{j+1}(\varepsilon), \lambda_{j+2}(\varepsilon)$ are simple and different when $\varepsilon \rightarrow 0$.

## 2. A process of finding the full asymptotic formula of the eigenvalues and the eigenfunctions $A$. <br> The case of double eigenvalues :

Put $\lambda_{j+k}(\varepsilon)$ from (7) into (1) and (2) :

$$
\left[( \Delta + \lambda _ { j } + \lambda _ { j } ^ { < 1 > } \varepsilon + \lambda _ { j } ^ { < 2 > } \varepsilon ^ { 2 } + \lambda _ { j } ^ { < 3 > } \varepsilon ^ { 3 } + 0 ( \varepsilon ^ { 4 } ) ] \left[\left(u_{j o}+v_{j o}\right)+\varepsilon\left(u_{j 1}+v_{j 1}\right)+\right.\right.
$$

(8) $\left.+\varepsilon^{2}\left(u_{j 2}+v_{j 2}\right)+\varepsilon^{3}\left(u_{j 3}+v_{j 3}\right)+\varepsilon^{4}\left(u_{j 4}+v_{j 4}\right)+0\left(\varepsilon^{5}\right)\right]=0$ in $\Omega_{\varepsilon}$
(9) $\left.\left[\left(u_{j o}+v_{j o}\right)+\varepsilon\left(u_{j 1}+v_{j 1}\right)+\varepsilon^{2}\left(u_{j 2}+v_{j 2}\right)+\cdots+0\left(\varepsilon^{5}\right)\right]\right|_{\partial \Omega_{\varepsilon}}=0$

$$
\left[( \Delta + \lambda _ { j } + \lambda _ { j + 1 } ^ { < 1 > } \varepsilon + \lambda _ { j + 1 } ^ { < 2 > } \varepsilon ^ { 2 } + \lambda _ { j + 1 } ^ { < 3 > } \varepsilon ^ { 3 } + 0 ( \varepsilon ^ { 4 } ) ] \left[\left(p_{j o}+q_{j o}\right)+\varepsilon\left(p_{j 1}+q_{j 1}\right)+\right.\right.
$$

(10) $\left.+\varepsilon^{2}\left(p_{j 2}+q_{j 2}\right)+\varepsilon^{3}\left(p_{j 3}+q_{j 3}\right)+\varepsilon^{4}\left(p_{j 4}+q_{j 4}\right)+0\left(\varepsilon^{5}\right)\right]=0$ in $\Omega_{\varepsilon}$
(11) $\left.\left[\left(p_{j o}+q_{j o}\right)+\varepsilon\left(p_{j 1}+q_{j 1}\right)+\varepsilon^{2}\left(p_{j 2}+q_{j 2}\right)+\cdots+0\left(\varepsilon^{5}\right)\right]\right|_{\partial \Omega_{\varepsilon}}=0$
where

$$
\begin{aligned}
u_{j}(x, \varepsilon) & =\left[\left(u_{j o}+v_{j o}\right)+\varepsilon\left(u_{j 1}+v_{j 1}\right)+\varepsilon^{2}\left(u_{j 2}+v_{j 2}\right)+\ldots\right] \\
u_{j+1}(X, \varepsilon) & =\left[\left(p_{j 0}+q_{j 0}\right)+\varepsilon\left(p_{j 1}+q_{j 1}\right)+\varepsilon^{2}\left(p_{j 2}+q_{j 2}\right)+\ldots\right]
\end{aligned}
$$

denote eigenfunctions corresponding to $\lambda_{j}(\varepsilon), \lambda_{j+1}(\varepsilon)$. Functions $u_{j 0}(x)$, $u_{j 1}(x), \ldots, p_{j 0}(x), p_{j 1}(x), \ldots$ are defined in $\Omega$ and they keep an asymptotic expansion as the functions $m_{k j}(x)$ from (5). Functions $v_{j 0}(\xi), v_{j 1}(\xi)$, $q_{j 0}(\xi), q_{j 1}(\xi), \ldots$ are defined in $\mathbb{R}^{3} \backslash B_{1}$ and they keep an asymptotic expansions as the function $n_{k j}(\xi)$ from (6). In the following we shall write $u_{0}(x), u_{1}(x), \ldots, p_{0}(x), p_{1}(x), \ldots, v_{0}(\xi), v_{1}(\xi), \ldots, q_{0}(\xi), q_{1}(\xi), \ldots$ for $u_{j 0}(x), u_{j 1}(x), \ldots, \quad p_{j 0}(x), p_{j 1}(x), \ldots, \quad v_{j 0}(\xi), v_{j 1}(\xi), \ldots, q_{j 0}(\xi), q_{j 1}(\xi), \ldots$ Comparing the coefficients in the identical orders of $\varepsilon$ in (8)-(11) one obtain :

$$
\begin{aligned}
& \varepsilon^{0}\left\{\begin{array}{l}
\Delta u_{0}(x)+\lambda_{j} u_{0}(x)=0, \quad \text { in } \Omega \\
\left.u_{0}(x)\right|_{\partial \Omega}=0
\end{array}\right. \\
& \varepsilon^{0}\left\{\begin{array}{l}
\Delta p_{0}(x)+\lambda_{j} p_{0}(x)=0, \quad \text { in } \Omega \\
\left.p_{0}(x)\right|_{\partial \Omega}=0
\end{array}\right.
\end{aligned}
$$

Hence $u_{0}(x)=a_{0}^{1} u_{j}(x)+a_{0}^{2} u_{j+1}(x), p_{0}(x)=b_{0}^{1} u_{j}(x)+b_{0}^{2} u_{j+1}(x)$. Since $\Delta_{\xi}=\varepsilon^{2} \Delta_{x}$ then

$$
\varepsilon^{-2}\left\{\begin{array} { l } 
{ \Delta v _ { 0 } ( \xi ) = 0 , \quad \text { in } \mathbb { R } ^ { 3 } \backslash B _ { 1 } } \\
{ v _ { 0 } ( \xi ) | _ { \partial B _ { 1 } } = 0 } \\
{ \operatorname { l i m } _ { | \xi | \rightarrow \infty } v _ { 0 } ( \xi ) = 0 }
\end{array} \quad \varepsilon ^ { - 2 } \left\{\begin{array}{l}
\Delta q_{0}(\xi)=0, \quad \text { in } \mathbb{R}^{3} \backslash B_{1} \\
\left.q_{0}(\xi)\right|_{\partial B_{1}}=0 \\
\lim _{|\xi| \rightarrow \infty} q_{0}(\xi)=0 .
\end{array}\right.\right.
$$

Therefore $v_{0}(\xi)=q_{0}(\xi)=0$ and

$$
\begin{align*}
& \Delta u_{1}(x)+\lambda_{j} u_{1}(x)+\lambda_{j}^{<1>} u_{0}(x)=0, \quad \text { in } \Omega  \tag{12}\\
& \left.u_{1}(X)\right|_{\partial \Omega}=0 \tag{13}
\end{align*}
$$

$$
\begin{align*}
& \Delta p_{1}(x)+\lambda_{j} p_{1}(x)+\lambda_{j+1}^{<1>} p_{0}(x)=0, \quad \text { in } \Omega  \tag{14}\\
& \left.p_{1}(x)\right|_{\partial \Omega}=0 \tag{15}
\end{align*}
$$

For the solvability of the problems (12)-(15) we have $\lambda_{j}^{<1>}=\lambda_{j+1}^{<1>}=0$. Hence $u_{1}(x)=a_{1}^{1} u_{j}(x)+a_{1}^{2} u_{j+1}(x)$ and $p_{1}(x)=b_{1}^{1} u_{j}(x)+b_{1}^{2} u_{j+1}(x)$. Assume that under some conditions the eigenvalues $\lambda_{j}(\varepsilon)<\lambda_{j+1}(\varepsilon)$ for sufficiently small $\varepsilon$. In the process of finding the asymptotic formula that condition will be clear. If it happens, then we have $u_{0}{ }^{\perp} p_{0}$, i.e. if $u_{0}=$ $a_{0}^{1} u_{j}+a_{0}^{2} u_{j+1}$, so $p_{0}=-a_{0}^{2} u_{j}+a_{0}^{1} u_{j+1}$. Hence one can choose $u_{1}(x)=$ $c_{1} p_{0}(x)$ and $p_{1}(x)=d_{1} u_{0}(x)$. Suppose the functions $u_{1}(x)$ and $p_{1}(x)$ are found. Then the functions $v_{1}(\xi), q_{1}(\xi)$ satisfy :

$$
\begin{aligned}
& \varepsilon^{-1}\left\{\begin{array}{l}
\Delta v_{1}(\xi)=0, \quad \text { in } \mathbb{R}^{3} \backslash B_{1} \\
\left.v_{1}(\xi)\right|_{\partial B_{1}}=-\left(\operatorname{grad} u_{0}(0), \xi\right)=:-A_{1}(\theta) \\
\lim _{|\xi| \rightarrow \infty} v_{1}(\xi)=0
\end{array}\right. \\
& \varepsilon^{-1}\left\{\begin{array}{l}
\Delta q_{1}(\xi)=0, \quad \text { in } \mathbb{R}^{3} \backslash B_{1} \\
\left.q_{1}(\xi)\right|_{\partial B_{1}}=-\left(\operatorname{grad} p_{0}(0), \xi\right)=:-A_{2}(\theta) \\
\lim _{|\xi| \rightarrow \infty} q_{1}(\xi)=0
\end{array}\right.
\end{aligned}
$$

If $v_{1}(\xi), q_{1}(\xi)$ are found we can find $u_{2}(x)$ and $p_{2}(x)$ from

$$
\begin{align*}
& \Delta u_{2}(x)+\lambda_{j} u_{2}(x)+\lambda_{j}^{<2>} u_{0}(x)=0, \quad \text { in } \Omega  \tag{16}\\
& \left.u_{2}(x)\right|_{\partial \Omega}=0 \tag{17}
\end{align*}
$$

$$
\begin{align*}
& \Delta p_{2}(x)+\lambda_{j} p_{2}(x)+\lambda_{j+1}^{<2>} p_{0}(x)=0, \quad \text { in } \Omega  \tag{18}\\
& \left.p_{2}(x)\right|_{\partial \Omega}=0 . \tag{19}
\end{align*}
$$

From the solvability of (16)-(19) we deduce that $\lambda_{j}^{<2>}=\lambda_{j+1}^{<2>}=0$. Therefore one can choose $u_{2}(x)=c_{2} p_{0}(x), p_{2}(x)=d_{2} u_{0}(x)$. The functions $v_{2}(\xi)$ and $q_{2}(\xi)$ satisfy :

$$
\left\{\begin{array} { l } 
{ \Delta v _ { 2 } ( \xi ) = 0 , \quad \text { in } \mathbb { R } ^ { 3 } \backslash B _ { 1 } } \\
{ v _ { 2 } ( \xi ) | _ { \partial B _ { 1 } } = - c _ { 1 } A _ { 2 } ( \theta ) - B _ { 1 } ( \theta ) , } \\
{ \operatorname { l i m } _ { | \xi | \rightarrow \infty } v _ { 2 } ( \xi ) = 0 }
\end{array} \quad \left\{\begin{array}{l}
\Delta q_{2}(\xi)=0, \quad \text { in } \mathbb{R}^{3} \backslash B_{1} \\
\left.q_{2}(\xi)\right|_{\partial B_{1}}=-d_{1} A_{1}(\theta)-B_{2}(\theta) \\
\lim _{|\xi| \rightarrow \infty} q_{2}(\xi)=0
\end{array}\right.\right.
$$

where $B_{1}(\theta)=\left.\sum_{i k=1}^{3} \frac{\partial^{2} u_{0}(0)}{\partial x_{i} \partial x_{k}} \xi_{i} \xi_{k}\right|_{\partial B_{1}}, B_{2}(\theta)=\left.\sum_{i k=1}^{3} \frac{\partial^{2} p_{0}(0)}{\partial x_{i} \partial x_{k}} \xi_{i} \xi_{k}\right|_{\partial B_{1}}$.
Note that $\Delta_{s^{2}} B_{1}(\theta)+6 B_{1}(\theta)=0$ and $\Delta_{s^{2}} B_{2}(\theta)+6 B_{2}(\theta)=0$. It follows that

$$
v_{2}(\xi)=-c_{1} A_{2}(\theta)|\xi|^{-2}-B_{1}(\theta)|\xi|^{-3}, q_{2}(\xi)=-d_{1} A_{1}(\theta)|\xi|^{-2}-B_{2}(\theta)|\xi|^{-3}
$$

Then $u_{3}(x), p_{3}(x)$ satisfy:

$$
\begin{align*}
& \Delta\left\{u_{3}-A_{1}(\theta)|x|^{-2}\right\}+\lambda_{j}\left\{u_{3}-A_{1}(\theta)|x|^{-2}\right\}+\lambda_{j}^{<3>} u_{0}=0  \tag{20}\\
& \left.\left\{u_{3}-A_{1}(\theta)|x|^{-2}\right\}\right|_{\partial \Omega}=0 \tag{21}
\end{align*}
$$

$$
\begin{align*}
& \Delta\left\{p_{3}-A_{2}(\theta)|x|^{-2}\right\}+\lambda_{j}\left\{p_{3}-A_{2}(\theta)|x|^{-2}\right\}+\lambda_{j+1}^{(3)} p_{0}=0  \tag{22}\\
& \left.\left\{p_{3}-A_{2}(\theta)|x|^{-2}\right\}\right|_{\partial \Omega}=0 \tag{23}
\end{align*}
$$

For solvability of (20)-(23) we have

$$
\lambda_{j}^{<3>}=3 \int_{\partial B_{1}} A_{1}^{2}(\theta) d \theta, \lambda_{j+1}^{<3>}=3 \int_{\partial B_{1}} A_{2}^{2}(\theta) d \theta
$$

Note that $A_{1}(\theta)=a_{0}^{1} u_{j}^{<1>}(\theta)+a_{0}^{2} u_{j+1}^{<1>}(\theta)$ and

$$
A_{2}(\theta)=-a_{0}^{2} u_{j}^{<1>}(\theta)+a_{0}^{1} u_{j+1}^{<1>}(\theta)
$$

Multiplying (20) by $u_{j}(x), u_{j+1}(x)$ and integrating over $\Omega_{\varepsilon}$ then turning $\varepsilon \rightarrow 0$ one obtain :
$\left(M-\frac{\lambda_{j}^{<3>}}{3} I\right)\binom{a_{0}^{1}}{a_{0}^{2}}=0$ (see the definition of $M$ in the introduction).
It means that $3^{-1} \lambda_{j}^{<3>}$ is the eigenvalue of the matrix $M$ and $\left(a_{0}^{1}, a_{0}^{2}\right)$ is its eigenvector. By analogy we can prove $3^{-1} \lambda_{j+1}^{<3>}$ is also eigenvalue of $M$. Therefore if $M$ has two different eigenvalues then $\lambda_{j}^{<3>}, \lambda_{j+1}^{<3>}$ and $\left(a_{0}^{1}, a_{0}^{2}\right)$ are defined uniquely. So we found $\lambda_{j}^{<3>}, \lambda_{j+1}^{<3>}, u_{0}(x) p_{0}(x), v_{0}(\xi)$,
$q_{0}(\xi), v_{1}(\xi), q_{1}(\xi)$. Continuing this procedure we can find $\lambda_{j}^{<4>}, \lambda_{j+1}^{<4>}, u_{1}(x)$, $p_{1}(x), v_{2}(\xi), q_{2}(\xi)$.

A step of induction : Assume that $\lambda_{j}^{<n+3>}, \lambda_{j+1}^{<n+3>}, u_{n}(x), p_{n}(x)$, $v_{n+1}(\xi), q_{n+1}(\xi)$ are defined. We show how to find the functions $\lambda_{j}^{<n+4>}$, $\lambda_{j+1}^{<n+4>}, u_{n+1}(x), p_{n+1}(x), v_{n+2}(\xi), q_{n+2}(\xi)$. In previous steps we have already known the equations for $u_{n+1}(x), p_{n+1}(x)$ and found the condition for their solvability. However, the solutions are defined non-uniquely. Writing once again these equations :

$$
\begin{aligned}
& \left\{\begin{array}{c}
\Delta u_{n+1}+\sum_{i=0}^{n+1} \lambda_{j}^{<i>} u_{n+1-i}+\sum_{i=0}^{n} \lambda_{j}^{<i>} v_{n-i}^{<1>}(\theta)|x|^{-1}+ \\
\sum_{i=0}^{n-1} \lambda_{j}^{<i>} v_{n-1-i}^{<2>}(\theta)|x|^{-2}=0 \\
\left.\left\{u_{n+1}+\sum_{i=1}^{n+1} v_{n+1-i}^{<i>}(\theta)|x|^{-i}\right\}\right|_{\partial \Omega}=0
\end{array}\right. \\
& \left\{\begin{array}{c}
\Delta p_{n+1}+\sum_{i=0}^{n+1} \lambda_{j+1}^{<i>} p_{n+1-i}+\sum_{i=0}^{n} \lambda_{j+1}^{<i>} q_{n-i}^{<1>}(\theta)|x|^{-1}+ \\
\sum_{i=0}^{n-1} \lambda_{j+1}^{<i>} q_{n-1-i}^{<2>}(\theta)|x|^{-2}=0 \\
\left.\left\{p_{n+1}+\sum_{i=1}^{n+1} q_{n+1-i}^{<i>}(\theta)|x|^{-i}\right\}\right|_{\partial \Omega}=0
\end{array}\right.
\end{aligned}
$$

Suppose that $U_{n+1}(x), P_{n+1}(x)$ are the solutions of the above problem such that

$$
\int_{\Omega} U_{n+1} u_{0} d x=\int_{\Omega} U_{n+1} p_{0} d x=\int_{\Omega} P_{n+1} u_{0} d x=\int_{\Omega} P_{n+1} p_{0} d x=0
$$

A general solution must be found in a form :

$$
u_{n+1}=U_{n+1}+c_{n+1} p_{0}, \quad p_{n+1}=P_{n+1}+d_{n+1} u_{0}
$$

By analogy we should find $u_{n+2}(x), p_{n+2}(x), u_{n+3}(x), p_{n+3}(x)$ in form :

$$
\begin{array}{ll}
u_{n+2}=U_{n+2}+c_{n+2} p_{0}, & p_{n+2}=P_{n+2}+d_{n+2} u_{0} . \\
u_{n+3}=U_{n+3}+c_{n+3} p_{0}, & p_{n+3}=P_{n+3}+d_{n+3} u_{0}
\end{array}
$$

Then $v_{n+2}(\xi), q_{n+2}(\xi)$ satisfy :

$$
\begin{aligned}
& \left\{\begin{array}{l}
\Delta v_{n+2}(\xi)+\sum_{i=0}^{n} \lambda_{j}^{<i>} \tilde{v}_{n-i}^{<2>}(\xi)=0 \\
\left.\left\{v_{n+2}(\theta)+u_{0}^{<n+2>}(\theta)+\cdots+u_{n+2}^{<0>}(\theta)\right\}\right|_{\partial B_{1}}=0 \\
\lim _{|\xi| \rightarrow \infty} v_{n+2}(\xi)=0
\end{array}\right. \\
& \left\{\begin{array}{l}
\Delta q_{n+2}(\xi)+\sum_{i=0}^{n} \lambda_{j+1}^{<i>} \tilde{q}_{n-i}^{<2>}(\xi)=0 \\
\left.\left\{q_{n+2}(\theta)+p_{0}^{<n+2>}(\theta)+\cdots+p_{n+2}^{<0>}(\theta)\right\}\right|_{\partial B_{1}}=0 \\
\lim _{|\xi| \rightarrow \infty} q_{n+2}(\xi)=0 .
\end{array}\right.
\end{aligned}
$$

Therefore $v_{n+2}=V_{n+2}-c_{n+1} A_{2}(\theta)|\xi|^{-2}, q_{n+2}=Q_{n+2}-d_{n+1} A_{1}(\theta)|\xi|^{-2}$. We denote by $V_{n+2}(\xi)$ and $Q_{n+2}(\xi)$ the solutions of the following problems :

$$
\begin{aligned}
& \left\{\begin{array}{l}
\Delta V_{n+2}(\xi)+\sum_{i=0}^{n} \lambda_{j}^{<i>} \tilde{v}_{n-i}^{<2>}(\xi)=0 \\
\left.\left\{V_{n+2}(\theta)+E_{n+2}(\theta)\right\}\right|_{\partial B_{1}}=0 \\
\lim _{|\xi| \rightarrow \infty} V_{n+2}(\xi)=0
\end{array}\right. \\
& \left\{\begin{array}{l}
\Delta Q_{n+2}(\xi)+\sum_{i=0}^{n} \lambda_{j+1}^{<i>} \tilde{q}_{n-i}^{<2>}(\xi)=0 \\
\left.\left\{Q_{n+2}(\theta)+F_{n+2}(\theta)\right\}\right|_{\partial B_{1}}=0 \\
\lim _{|\xi| \rightarrow \infty} Q_{n+2}(\xi)=0
\end{array}\right.
\end{aligned}
$$

where the functions

$$
\begin{aligned}
& E_{n+2}(\theta)=u_{0}^{<n+2>}(\theta)+\cdots+u_{n}^{<2>}(\theta)+U_{n+1}^{<1>}(\theta)+U_{n+2}^{<0>}(\theta) \\
& F_{n+2}(\theta)=p_{0}^{<n+2>}(\theta)+\cdots+p_{n}^{<2>}(\theta)+P_{n+1}^{<1>}(\theta)+P_{n+2}^{<0>}(\theta)
\end{aligned}
$$

are already defined from previous steps.
By analogy we should find $v_{n+3}(\xi), q_{n+3}(\xi)$ in a form

$$
\begin{gathered}
v_{n+3}(\xi)=V_{n+3}(\xi)-c_{n+2} A_{2}(\theta)|\xi|^{-2}-c_{n+1} B_{2}(\theta)|\xi|^{-3} \\
q_{n+3}(\xi)=Q_{n+3}(\xi)-d_{n+2} A_{1}(\theta)|\xi|^{-2}-d_{n+1} B_{1}(\theta)|\xi|^{-3}
\end{gathered}
$$

Finally we write equations for $u_{n+4}(x), p_{n+4}(x)$ :

$$
\begin{aligned}
& \left\{\begin{array}{c}
\Delta u_{n+4}+\sum_{i=0}^{n+4} \lambda_{j}^{<i>} u_{n+4-i}+\sum_{i=0}^{n+3} \lambda_{j}^{<i>} v_{n-i+3}^{\ll>}(\theta)|x|^{-1}+ \\
\sum_{i=0}^{n+2} \lambda_{j}^{<i>} v_{n-i+2}^{<2>}(\theta)|x|^{-2}=0 \\
\left.\left\{u_{n+4}+\sum_{i=1}^{n+4} v_{n+4-i}^{<i>}(\theta)|x|^{-i}\right\}\right|_{\partial \Omega}=0
\end{array}\right. \\
& \left\{\begin{array}{c}
\Delta p_{n+4}+\sum_{i=0}^{n+4} \lambda_{j+1}^{<i>} p_{n+4-i}+\sum_{i=0}^{n+3} \lambda_{j+1}^{<i>} q_{n-i+3}^{<1>}(\theta)|x|^{-1}+ \\
\sum_{i=0}^{n+2} \lambda_{j+1}^{<i>} q_{n-i+2}^{<2>}(\theta)|x|^{-2}=0 \\
\left.\left\{p_{n+4}+\sum_{i=1}^{n+4} q_{n+4-i}^{<i>}(\theta)|x|^{-i}\right\}\right|_{\partial \Omega}=0 .
\end{array}\right.
\end{aligned}
$$

Note that $\lambda_{j}^{<0>}=\lambda_{j+1}^{<0>}=\lambda_{j}, \lambda_{j}^{<1>}=\lambda_{j+1}^{<1>}=\lambda_{j}^{<2>}=\lambda_{j+1}^{<2>}=0$. So we have :

$$
\begin{align*}
& \Delta\left\{u_{n+4}(x)-c_{n+1} A_{2}(\theta)|x|^{-2}\right\}+\lambda_{j}\left\{u_{n+4}(x)-c_{n+1} A_{2}(\theta)|x|^{-2}\right\} \\
& \quad+\lambda_{j}^{<3>}\left\{U_{n+1}(x)+c_{n+1} p_{0}(x)\right\}+\lambda_{j}^{<n+4>} u_{0}(x)=G_{n}(x)  \tag{24}\\
& \left.\left\{u_{n+4}(x)-c_{n+1} A_{2}(\theta)|x|^{-2}\right\}\right|_{\partial \Omega}=H_{n}(x) \tag{25}
\end{align*}
$$

where the functions $G_{n}(x), H_{n}(x)$ are defined from previous steps. Multiplying (24) by $u_{0}(x), p_{0}(x)$ and integrating over $\Omega_{\varepsilon}$ as $\varepsilon \rightarrow 0$ we obtain immediately $c_{n+1}$ and $\lambda_{j}^{\langle n+4>}$. By analogy one can find $d_{n+1}$ and $\lambda_{j+1}^{<n+4>}$. Our procedure is ended.

## B. The case of a triple eigenvalue

We are interested only in the case of a bifurcation, i.e. $\lambda_{j}(\varepsilon) \leq \lambda_{j+1}(\varepsilon) \leq$ $\lambda_{j+2}(\varepsilon)$ when $\varepsilon$ is sufficiently small.

Suppose :
$\lambda_{j+k}(\varepsilon)=\lambda_{j}+\lambda_{j+k}^{<1>} \varepsilon^{1}+\lambda_{j+k}^{<2>} \varepsilon^{2}+\cdots+\lambda_{j+k}^{<M>} \varepsilon^{M}+0\left(\varepsilon^{M+1}\right) \quad(k=0,1,2)$
and

$$
\begin{aligned}
u_{j}(x, \varepsilon) & =\left[\left(u_{0}+v_{0}\right)+\varepsilon\left(u_{1}+v_{1}\right)+\varepsilon^{2}\left(u_{2}+v_{2}\right)+\ldots\right] \\
u_{j+1}(x, \varepsilon) & =\left[\left(p_{0}+q_{0}\right)+\varepsilon\left(p_{1}+q_{1}\right)+\varepsilon^{2}\left(p_{2}+q_{2}\right)+\ldots\right] \\
u_{j+2}(x, \varepsilon) & =\left[\left(r_{0}+s_{0}\right)+\varepsilon\left(r_{1}+s_{1}\right)+\varepsilon^{2}\left(r_{2}+s_{2}\right)+\ldots\right] .
\end{aligned}
$$

Putting $u_{j}(x, \varepsilon), u_{j+1}(x, \varepsilon), u_{j+2}(x, \varepsilon), \lambda_{j}(\varepsilon), \lambda_{j+1}(\varepsilon), \lambda_{j+2}(\varepsilon)$ into (1), (2) and comparing the coefficient in the identical order of $\varepsilon$ we obtain the quations for $u_{0}(x), p_{0}(x), r_{0}(x)$ as the equations for $u_{0}(x), p_{0}(x)$ in the case of double eigenvalues.

Therefore :

$$
\begin{aligned}
& u_{0}(x)=a_{0}^{1} u_{j}^{*}(x)+a_{0}^{2} u_{j+1}^{*}(x)+a_{0}^{3} u_{j+2}^{*}(x) \\
& p_{0}(x)=b_{0}^{1} u_{j}^{*}(x)+b_{0}^{2} u_{j+1}^{*}(x)+b_{0}^{3} u_{j+2}^{*}(x) \\
& r_{0}(x)=c_{0}^{1} u_{j}^{*}(x)+c_{0}^{2} u_{j+1}^{*}(x)+c_{0}^{3} u_{j+2}^{*}(x)
\end{aligned}
$$

(see the definition of $u_{j}, u_{j+1}, u_{j+2}$ in the introduction). Since we are only interested in the case of a bifurcation, it follows that the functions $u_{0}, p_{0}, r_{0}$ must be orthogonal. Then we have

$$
v_{0}(\xi)=-u_{0}(0)|\xi|^{-1}, q_{0}(\xi)=-p_{0}(0)|\xi|^{-1}, s_{0}(\xi)=-r_{0}(0)|\xi|^{-1}
$$

Now we write the equations for $u_{1}(x), p_{1}(x), r_{1}(x)$

$$
\left\{\begin{array}{l}
\Delta u_{1}(x)+\lambda_{j} u_{1}(x)+\lambda_{j}^{<1>} u_{0}(x)-\lambda_{j} u_{0}(0)|x|^{-1}=0 \quad \text { in } \Omega \\
\left.u_{1}(x)\right|_{\partial \Omega}=\left.u_{0}(0)|x|^{-1}\right|_{\partial \Omega}
\end{array}\right.
$$

From the conditions of their solvability and the conditions $\lambda_{j}(\varepsilon)<$ $\lambda_{j+1}(\varepsilon)<\lambda_{j+2}(\varepsilon)$ when $\varepsilon$ is sufficiently small. We have

$$
\lambda_{j}^{<1>}=\lambda_{j+1}^{<1>}=0, \lambda_{j+2}^{<1>}=4 \pi\left\{u_{j+2}^{*}(0)\right\}^{2}, c_{0}^{1}=c_{0}^{2}=a_{0}^{3}=b_{0}^{3}=0, c_{0}^{3}=1
$$

So the function $r_{0}(x)$ is defined. Suppose provisionally the function $u_{0}(x)$, $p_{0}(x)$ are also defined. We show how to find $\lambda_{j+2}^{<2>}, s_{1}(\xi), r_{1}(x)$. Note
the problems for $r_{1}(x)$ are sovable. However the solution is defined nonuniquely. Suppose that $R_{1}(x)$ is a solution such that $\int_{\Omega} R_{1} u_{0} d x=$ $\int_{\Omega} R_{1} p_{0} d x=\int_{\Omega} R_{1} r_{0} d x=0$. A general solution $r_{1}(x)$ may be written as follows : $r_{1}(x)=R_{1}(x)+a_{1} u_{0}(x)+b_{1} p_{0}(x)$. Assume that $a_{1}, b_{1}$ are found. Then $s_{1}(\xi)$ satisfies :

$$
\left\{\begin{array}{l}
\Delta s_{1}(\xi)=0, \text { in } \mathbb{R}^{3} \backslash B_{1} \\
\left.s_{1}(\xi)\right|_{\partial B_{1}}=-R_{1}(0)-r_{0}^{<1>}(\theta) \\
\lim _{|\xi| \rightarrow \infty} s_{1}(\xi)=0
\end{array}\right.
$$

Therefore $s_{1}(\xi)=-R_{1}(0)|\xi|^{-1}-r_{0}^{<1>}(\theta)|\xi|^{-2}$. We obtain the equations for $r_{2}(x)$

$$
\begin{array}{cr}
\Delta r_{2}-\lambda_{j} R_{1}(0)|x|^{-1}+\lambda_{j} r_{2}+\lambda_{j+2}^{<1>}\left(R_{1}+a_{1} u_{0}+b_{1} p_{0}\right)+ \\
\left.\left\{r_{2}(x)-R_{1}(0)|x|^{-1}\right\}\right|_{\partial \Omega}=0 . & \lambda_{j+2}^{<2>} r_{0}=0
\end{array}
$$

Multiplying (26) by $u_{0}(x), p_{0}(x), r_{0}(x)$ and intergrating over $\Omega_{\varepsilon}$ when $\varepsilon \rightarrow 0$ one deduce that $\lambda_{j+2}^{<2>}=0, a_{1}=b_{1}=0$. So we found $r_{1}(x), s_{1}(\xi)$, $\lambda_{j+2}^{<2>}$. By induction, as in the case of double eigenvalues, we can find all $r_{n}(x), s_{n}(\xi), \lambda_{j+2}^{<n+2>}$. Now, under some conditions, we show how to find $u_{0}(x)$ and $p_{0}(x)$. In the first step we had :

$$
\begin{aligned}
& u_{0}(x)=a_{0}^{1} u_{j}^{*}(x)+a_{0}^{2} u_{j+1}^{*}(x), p_{0}(x)=b_{0}^{1} u_{j}^{*}(x)+b_{0}^{2} u_{j+1}^{*}(x) \\
& \lambda_{j}^{<1>}=\lambda_{j+1}^{<1>}=0 .
\end{aligned}
$$

Since : $u_{0}(0)=p_{0}(0)=0$ it follows $v_{0}(\xi)=q_{0}(\xi)=0$. From the equations for $u_{1}(x), p_{1}(x)$ we can find them in a form :

$$
u_{1}(x)=c_{1} p_{0}(x)+d_{1} r_{0}(x), p_{1}(x)=e_{1} u_{0}(x)+f_{1} r_{0}(x)
$$

Suppose that $c_{1}, d_{1}, e_{1}, f_{1}$ are known. Then, from the equations for $v_{1}(\xi)$, $q_{1}(\xi)$ we obtain immediately :

$$
v_{1}(\xi)=-d_{1}|\xi|^{-1}-u_{0}^{<1>}(\theta)|\xi|^{-2}, q_{1}(\xi)=-f_{1}|\xi|^{-1}-p_{0}^{<1>}(\theta)|\xi|^{-2}
$$

Therefore the functions $p_{2}(x), u_{2}(x)$ satisfy :

$$
\begin{aligned}
& \left\{\begin{array}{l}
\Delta\left(u_{2}-d_{1}|x|^{-1}\right)+\lambda_{j}\left(u_{2}-d_{1}|x|^{-1}\right)+\lambda_{j}^{<2>} u_{0}(x)=0 \\
\left.\left(u_{2}-d_{1}|x|^{-1}\right)\right|_{\partial \Omega}=0
\end{array}\right. \\
& \left\{\begin{array}{l}
\Delta\left(p_{2}-f_{1}|x|^{-1}\right)+\lambda_{j}\left(p_{2}-f_{1}|x|^{-1}\right)+\lambda_{j+1}^{<2>} p_{0}(x)=0 \\
\left.\left(p_{2}-f_{1}|x|^{-1}\right)\right|_{\partial \Omega}=0
\end{array}\right.
\end{aligned}
$$

From the conditions for solvability of this equation we deduce :

$$
\begin{gathered}
\lambda_{j}^{<2>}=\lambda_{j+1}^{<2>}=0, \quad d_{1}=f_{1}=0, \\
p_{2}(x)=P_{2}(x)+e_{2} u_{0}(x)+f_{2} r_{0}(x), \quad u_{2}(x)=U_{2}(x)+c_{2} p_{0}(x)+d_{2} r_{0}(x),
\end{gathered}
$$

where $P_{2}(x), U_{2}(x)$ denote the solutions such that:

$$
\begin{aligned}
\int_{\Omega} U_{2} u_{0} d x=\int_{\Omega} U_{2} p_{0} d x= & \int_{\Omega} U_{2} r_{0} d x= \\
& \int_{\Omega} P_{2} u_{0} d x= \\
& \int_{\Omega} P_{2} p_{0} d x=\int_{\Omega} P_{2} r_{0} d x=0 .
\end{aligned}
$$

From the equations for $v_{2}(\xi), q_{2}(\xi)$ we have :

$$
\begin{aligned}
& v_{2}(\xi)=-U_{2}(0)|\xi|^{-1}-d_{2} r_{0}(0)|\xi|^{-1}-c_{1} p_{0}^{<1>}(\theta)|\xi|^{-2}-u_{0}^{<2>}(\theta)|\xi|^{-3} \\
& q_{2}(\xi)=-p_{2}(0)|\xi|^{-1}-f_{2} r_{0}(0)|\xi|^{-1}-e_{1} u_{0}^{<1>}(\theta)|\xi|^{-2}-p_{0}^{<2>}(\theta)|\xi|^{-3}
\end{aligned}
$$

Finally we write the equations for $u_{3}(x), p_{3}(x)$

$$
\begin{aligned}
& \left\{\begin{array}{r}
\Delta u_{3}+\lambda_{j} u_{3}+\lambda_{j}^{<3>} u_{0}-\lambda_{j}\left(U_{2}(0)|x|^{-1}+d_{2} r_{0}(0)|x|^{-1}+\right. \\
u_{0}^{<1>}(\theta)|x|^{-2}=0 \\
\left.\left(u_{3}-U_{2}(0)|x|^{-1}-d_{2} r_{0}(0)|x|^{-1}-u_{0}^{<1>}(\theta)|x|^{-2}\right)\right|_{\partial \Omega}=0
\end{array}\right. \\
& \left\{\begin{array}{r}
\Delta p_{3}+\lambda_{j} p_{3}+\lambda_{j+1}^{<3>} p_{0}-\lambda_{j}\left(P_{2}(0)|x|^{-1}+f_{2} r_{0}(0)|x|^{-1}+\right. \\
\left.p_{0}^{<1>}(\theta)|x|^{-2}\right)=0 \\
\left.\left(p_{3}-P_{2}(0)|x|^{-1}-f_{2} r_{0}(0)|x|^{-1}-p_{0}^{<1>}(\theta)|x|^{-2}\right)\right|_{\partial \Omega}=0
\end{array}\right.
\end{aligned}
$$

From these conditions we have :

$$
\begin{aligned}
\lambda_{j}^{<3>} & =3 \int_{\partial B_{1}}\left|u_{0}^{<1>}(\theta)\right|^{2} d \theta, \quad \lambda_{j+1}^{<3>}=3 \int_{\partial B_{1}}\left|P_{0}^{<1>}(\theta)\right|^{2} d \theta \\
d_{2} & =\left[r_{0}(0)\right]^{-1} U_{2}(0), \quad f_{2}=\left[r_{0}(0)\right]^{-1} P_{2}(0)
\end{aligned}
$$

As in the case of double eigenvalues we conclude that $3^{-1} \lambda_{j}^{<3>}$ and $3^{-1} \lambda_{j+1}^{<3>}$ are the eigenvalues of the matrix $M^{*}$ (see the definition in the introduction) and the vector $\left(a_{0}^{1}, a_{0}^{2}\right)$ is its eigenvector. So we found $\lambda_{j}^{<3>}, \lambda_{j+1}^{<3>}, u_{0}(x)$, $p_{0}(x), v_{0}(\xi), q_{0}(\xi), v_{1}(\xi), q_{1}(\xi)$.

A step of induction : Suppose that $\lambda_{j}^{<n+3>}, \lambda_{j+1}^{<n+3>}, u_{n}(x), p_{n}(x)$, $v_{n+1}(\xi), q_{n+1}(\xi)$ are found. We shall find $\lambda_{j}^{<n+4>}, \lambda_{j+1}^{<n+4>}, u_{n+1}(x)$, $p_{n+1}(x), v_{n+2}(\xi), q_{n+2}(\xi)$ as follows. In previous steps we have known the equations for $u_{n+1}(x), p_{n+1}(x)$ and found the conditions for their solvability. However, the solutions are defined non-uniquely. Assume that $U_{n+1}(x), P_{n+1}(x)$ are the solutions such that

$$
\begin{aligned}
& \int_{\Omega} U_{n+1} u_{0} d x=\int_{\Omega} U_{n+1} p_{0} d x=\int_{\Omega} U_{n+1} r_{0} d x=0 \\
& \int_{\Omega} P_{n+1} u_{0} d x=\int_{\Omega} P_{n+1} p_{0} d x=\int_{\Omega} P_{n+1} r_{0} d x=0 .
\end{aligned}
$$

The functions $u_{n+1}(x), p_{n+1}(x)$ may be found in a form :

$$
u_{n+1}=c_{n+1} p_{0}+d_{n+1} r_{0}+U_{n+1}, p_{n+1}=e_{n+1} u_{0}+f_{n+1} r_{0}+P_{n+1}
$$

By analogy we have :

$$
\begin{array}{ll}
u_{n+2}=c_{n+2} p_{0}+d_{n+2} r_{0}+U_{n+2}, & p_{n+2}=e_{n+2} u_{0}+f_{n+2} r_{0}+P_{n+2} \\
u_{n+3}=c_{n+3} p_{0}+d_{n+3} r_{0}+U_{n+3}, & p_{n+3}=e_{n+3} u_{0}+f_{n+3} r_{0}+P_{n+3}
\end{array}
$$

From the equations for $v_{n+2}(\xi), q_{n+2}(\xi)$ we claim that :

$$
v_{n+2}(\xi)=V_{n+2}(\xi)-d_{n+1} A_{3}(\theta)|\xi|^{-2}-d_{n+2} r_{0}(0)|\xi|^{-1}-c_{n+1} A_{2}(\theta)|\xi|^{-2}
$$

$$
q_{n+2}(\xi)=Q_{n+2}(\xi)-f_{n+1} A_{3}(\theta)|\xi|^{-2}-f_{n+2} r_{0}(0)|\xi|^{-1}-e_{n+1} A_{1}(\theta)|\xi|^{-2}
$$

where $A_{1}(\theta)=u_{0}^{<1>}(\theta), A_{2}(\theta)=p_{0}^{<1>}(\theta), A_{3}(\theta)=r_{0}^{<1>}(\theta)$ and $V_{n+2}(\xi)$, $Q_{n+2}(\xi)$ are defined by the equations as in the case of double eigenvalues.

By analogy we have

$$
\begin{gathered}
v_{n+3}(\xi)=V_{n+3}(\xi)-\left[d_{n+1}\left\{B_{3}(\theta)-6^{-1} \lambda_{j} r_{0}(0)\right\}+c_{n+1} B_{2}(\theta)\right]|\xi|^{-3} \\
-\left\{c_{n+2} A_{2}(\theta)+d_{n+2} A_{3}(\theta)\right\}|\xi|^{-2}-\left\{d_{n+3} r_{0}(0)+6^{-1} d_{n+1} \lambda_{j} r_{0}(0)\right\}|\xi|^{-1} \\
q_{n+3}(\xi)=Q_{n+3}(\xi)-\left[f_{n+1}\left\{B_{3}(\theta)-6^{-1} \lambda_{j} r_{0}(0)\right\}+e_{n+1} B_{1}(\theta)\right]|\xi|^{-3} \\
-\left\{e_{n+2} A_{1}(\theta)+f_{n+2} A_{3}(\theta)\right\}|\xi|^{-2}-\left\{f_{n+3} r_{0}(0)+6^{-1} f_{n+1} \lambda_{j} r_{0}(0)\right\}|\xi|^{-1}
\end{gathered}
$$

where the functions $B_{1}(\theta)=u_{0}^{<2>}(\theta), B_{2}(\theta)=p_{0}^{<2>}(\theta), B_{3}(\theta)=r_{0}^{<2>}(\theta)$, $V_{n+3}(\xi), Q_{n+3}(\xi), d_{n+1}, d_{n+2}, f_{n+1}, f_{n+2}$ are defined.

Finally, we write the equations for $u_{n+4}(x), p_{n+4}(x)$ :

$$
\begin{array}{rr}
\Delta \bar{u}_{n+4}(x)+\lambda_{j} \bar{u}_{n+4}(x)+\lambda_{j}^{<n+4>} u_{0}+\lambda_{j}^{<3>}\left(U_{n+1}+c_{n+1} p_{0}+\right. \\
\left.d_{n+1} r_{0}\right)=G_{n+4}(x) \\
\left.\bar{u}_{n+4}\right|_{\partial \Omega}=H_{n+4}(x) & \tag{29}
\end{array}
$$

$$
\begin{array}{rr}
\Delta \bar{p}_{n+4}(x)+\lambda_{j} \bar{p}_{n+4}(x)+\lambda_{j+1}^{<n+4>} p_{0}+\lambda_{j+1}^{<3>}\left(P_{n+1}+e_{n+1} u_{0}+\right. \\
\left.f_{n+1} r_{0}\right)=I_{n+4}(x) \\
\left.\bar{p}_{n+4}\right|_{\partial \Omega}=K_{n+4}(x) & \tag{31}
\end{array}
$$

$$
\text { where } \quad \bar{u}_{n+4}(x):=\left(u_{n+4}-d_{n+3} r_{0}(0)|x|^{-1}-c_{n+1} A_{2}(\theta)|x|^{-2}\right)
$$

$$
\text { and } \quad \bar{p}_{n+4}(x):=\left(p_{n+4}-f_{n+3} r_{0}(0)|x|^{-1}-e_{n+1} A_{1}(\theta)|x|^{-2}\right)
$$

From the coditions for solvability of (28) - (31) we have :

$$
\begin{gathered}
c_{n+1}=\left(\lambda_{j}^{<3>}-\lambda_{j+1}^{<3>}\right)^{-1}\left[\int_{\Omega} G_{n+4} p_{0} d x+\int_{\partial \Omega} H_{n+4} \frac{\partial p_{0}}{\partial n} d s\right] \\
e_{n+1}=\left(\lambda_{j}^{<3>}-\lambda_{j+1}^{<3>}\right)^{-1}\left[\int_{\Omega} I_{n+4} u_{0} d x+\int_{\partial \Omega} K_{n+4} \frac{\partial u_{0}}{\partial n} d s\right] \\
\lambda_{j}^{<n+4>}-\left[\int_{\Omega} G_{n+4} p_{0} d x+\int_{\partial \Omega} H_{n+4} \frac{\partial p_{0}}{\partial n} d s-\lambda_{j}^{<3>} c_{n+1}\right] \\
\lambda_{j+1}^{<n+4>}=-\left[\int_{\Omega} I_{n+4} u_{0} d x+\int_{\partial \Omega} K_{n+4} \frac{\partial u_{0}}{\partial n} d s-\lambda_{j+1}^{<3>} e_{n+1}\right] \\
d_{n+3}=\left(4 \pi r_{0}^{2}(0)\right)^{-1}\left[\int_{\Omega} G_{n+4} r_{0} d x+\int_{\partial \Omega} H_{n+4} \frac{\partial r_{0}}{\partial n} d s-\lambda_{j}^{<3>} d_{n+1}\right] \\
f_{n+3}=\left(4 \pi r_{0}^{2}(0)\right)^{-1}\left[\int_{\Omega} I_{n+4} r_{0} d x+\int_{\partial \Omega} K_{n+4} \frac{\partial r_{0}}{\partial n} d s-\lambda_{j+1}^{<3>} f_{n+1}\right]
\end{gathered}
$$

Our procedure is ended.

## 3. Proof

We shall prove our results only in the case of double eigenvalues. The case of triple eigenvalues may be proved similarly. Suppose

$$
\begin{aligned}
\alpha_{N}(x, \varepsilon) & =\sum_{i=0}^{N} \varepsilon^{i}\left(u_{i}(x)+v_{i}\left(x \varepsilon^{-1}\right)\right), \beta_{N}(x, \varepsilon)=\sum_{i=0}^{N} \varepsilon^{i}\left(p_{i}(x)+q_{i}\left(x \varepsilon^{-1}\right)\right) \\
\lambda_{j}^{(N)}(\varepsilon) & =\sum_{i=0}^{N} \lambda_{j}^{(i)} \varepsilon^{i}, \lambda_{j+1}^{(N)}(\varepsilon)=\sum_{i=0}^{N} \lambda_{i+1}^{(i)} \varepsilon^{i} .
\end{aligned}
$$

We have

$$
\begin{aligned}
& \Delta \alpha_{N}(x, \varepsilon)+\lambda_{j}^{<N>}(\varepsilon) \alpha_{N}(x, \varepsilon)=\sum_{i=0}^{N} \varepsilon^{i}\left[\Delta u_{i}+\sum_{p=0}^{i-1} \lambda_{j}^{<p>} u_{i-p-1}+\sum_{p=0}^{i-2} \lambda_{j}^{<p>}\right. \\
& |x|^{-1} v_{i-p-2}^{<1>}(\theta) \\
& \left.+\sum_{p=0}^{i-3} \lambda_{j}^{<p>}|x|^{-2} v_{i-p-3}^{<2>}(\theta)\right]+\sum_{i=0}^{N} \varepsilon^{i-2}\left[\Delta_{\xi} v_{i}(\xi)+\sum_{p=0}^{i-3} \lambda_{j}^{<p>} \tilde{v}_{i-p-3}^{<2>}(\xi)\right] \\
& +\varepsilon \sum_{i=0}^{N-1} \varepsilon^{i} \lambda_{j}^{<i>}\left[\sum_{p=N-i}^{N} \varepsilon^{p} u_{p}+\sum_{p=N-i-2}^{N} \varepsilon^{p} \tilde{v}_{p}^{<2>}\left(x \varepsilon^{-1}\right)\right. \\
& \left.+\sum_{p=N-i-1}^{N} \varepsilon^{p+1}|x|^{-1} v_{p}^{<1>}(\theta)+\sum_{p=N-i-2}^{N} \varepsilon^{p+2}|x|^{-2} v_{p}^{<2>}(\theta)\right] .
\end{aligned}
$$

Obviously

$$
\begin{aligned}
\left|\Delta \alpha_{N}(x, \varepsilon)+\lambda_{j}^{<N>}(\varepsilon) \alpha_{N}(x, \varepsilon)\right| & =0\left(\varepsilon^{N+1}|x|^{-2}\right)=0\left(\varepsilon^{N-1}\right) \quad\left(x \in \Omega_{\varepsilon}\right) \\
\left.\alpha_{N}\right|_{\partial \Omega_{\varepsilon}} & =0\left(\varepsilon^{N+1}\right) .
\end{aligned}
$$

By analogy we can see :

$$
\begin{aligned}
\left|\Delta \beta_{N}(x, \varepsilon)+\lambda_{j+1}^{<N>}(\varepsilon) \beta_{N}(x, \varepsilon)\right| & =0\left(\varepsilon^{N+1}|x|^{-2}\right)=0\left(\varepsilon^{N-1}\right) \quad\left(x \in \Omega_{\varepsilon}\right) \\
\left.\beta_{N}\right|_{\partial \Omega_{\varepsilon}} & =0\left(\varepsilon^{N+1}\right) .
\end{aligned}
$$

Suppose that $\alpha_{N}^{*}(x, \varepsilon)=g_{N}(\varepsilon)\left[\alpha_{N}(x, \varepsilon)-\Gamma_{1}(x) \sum_{i=0}^{N} \varepsilon^{i} \tilde{v}_{i}^{(N-i)}\left(x \varepsilon^{-1}\right)-\right.$ $\left.\Gamma_{2}\left(x \varepsilon^{-1}\right) \sum_{i=0}^{N} \varepsilon^{i} \tilde{u}_{i}^{(N-i)}(x)\right]$,

$$
\begin{gathered}
\beta_{N}^{*}(x, \varepsilon)=k_{N}(\varepsilon)\left[\beta_{N}(x, \varepsilon)-\Gamma_{1}(x) \sum_{i=0}^{N} \varepsilon^{i} \tilde{v}_{i}^{(N-i)}\left(x \varepsilon^{-1}\right)\right. \\
\left.-\Gamma_{2}\left(x \varepsilon^{-1}\right) \sum_{i=0}^{N} \varepsilon^{i} \tilde{u}_{i}^{(N-i)}(x)\right]
\end{gathered}
$$

where $\Gamma_{1}(x) \in C^{\infty}\left(\mathbb{R}^{3}\right), \Gamma_{1}(x) \equiv 1$ in a neighborhood of $\partial \Omega$ and $\Gamma_{1}(x)=0$ in a neighborhood of $\{0\}$ and $\Gamma_{2}(x) \in C_{0}^{\infty}\left(\mathbb{R}^{3}\right), \Gamma_{2}(x) \equiv 1$ in a neighborhood of $\bar{B}_{1}$. The constants $g_{N}(\varepsilon), k_{N}(\varepsilon)$ are chosen such that

$$
\left\|\alpha_{N}^{*}(x, \varepsilon)\right\|_{L^{2}\left(\Omega_{\varepsilon}\right)}=\left\|\beta_{N}^{*}(x, \varepsilon)\right\|_{L^{2}\left(\Omega_{\varepsilon}\right)}=1 .
$$

It is easy to see

$$
\begin{aligned}
& \left\{\begin{array}{l}
\Delta \alpha_{N}^{*}(x, \varepsilon)+\lambda_{j}^{<N>}(\varepsilon) \alpha_{N}^{*}(x, \varepsilon)=L_{N}(x, \varepsilon) \text { in } \Omega_{\varepsilon} \\
\left.\alpha_{N}^{*}(x, \varepsilon)\right|_{\partial \Omega_{\varepsilon}}=0
\end{array}\right. \\
& \left\{\begin{array}{l}
\Delta \beta_{N}^{*}(x, \varepsilon)+\lambda_{j+1}^{<N>}(\varepsilon) \beta_{N}^{*}(x, \varepsilon)=M_{N}(x, \varepsilon) \text { in } \Omega_{\varepsilon} \\
\left.\beta_{N}^{*}(x, \varepsilon)\right|_{\partial \Omega_{\varepsilon}}=0 .
\end{array}\right.
\end{aligned}
$$

Expand $\alpha_{N}^{*}(x, \varepsilon)$ and $\beta_{N}^{*}(x, \varepsilon)$ in the series of orthonormal eigenfunctions $u_{1}(x, \varepsilon), u_{2}(x, \varepsilon), \ldots$ in $\Omega_{\varepsilon}$ one have :

$$
\begin{aligned}
& \alpha_{N}^{*}(x, \varepsilon)=\sum_{i=1}^{\infty} \alpha_{i}(\varepsilon) u_{i}(x, \varepsilon) \quad \text { where } \quad \sum_{i=1}^{\infty} \alpha_{i}^{2}(\varepsilon)=1 \\
& \beta_{N}^{*}(x, \varepsilon)=\sum_{i=1}^{\infty} \beta_{i}(\varepsilon) u_{i}(x, \varepsilon) \quad \text { where } \quad \sum_{i=1}^{\infty} \beta_{i}^{2}(\varepsilon)=1
\end{aligned}
$$

We claim that

$$
\begin{array}{r}
\Delta \alpha_{N}^{*}(x, \varepsilon)=-\sum_{i=1}^{\infty} \lambda_{i}(\varepsilon) \alpha_{i}(\varepsilon) u_{i}(x, \varepsilon)=-\lambda_{j}^{<N>}(\varepsilon) \sum_{i=1}^{\infty} \alpha_{i}(\varepsilon) u_{i}(x, \varepsilon)+ \\
L_{N}(x, \varepsilon)
\end{array}
$$

Obviously $\left.\left|D^{\alpha} L_{N}(x, \varepsilon)\right|\right|_{\Omega_{\varepsilon}}=0\left(\varepsilon^{N+1}|x|^{-|\alpha|}\right)$.
Therefore $\left|\lambda_{j}^{<N>}(\varepsilon)-\lambda_{j}(\varepsilon)\right| \sim\left|\lambda_{j+1}^{<N>}(\varepsilon)-\lambda_{j+1}^{<N>}(\varepsilon)\right|=0\left(\varepsilon^{N-1}\right)$.
Since we have known $\lim _{\varepsilon \rightarrow 0} \lambda_{j}(\varepsilon)=\lambda_{j} \quad(j=1, \ldots \infty)$ it follows that

$$
\left\|\alpha_{N}^{*}(x, \varepsilon)-u_{j}(x, \varepsilon)\right\|_{L^{2}\left(\Omega_{\varepsilon}\right)} \sim\left\|\beta_{N}^{*}(x, \varepsilon)-u_{j+1}(x, \varepsilon)\right\|_{L^{2}\left(\Omega_{\varepsilon}\right)}=0\left(\varepsilon^{N-1}\right)
$$

We have also :

$$
\begin{gathered}
\Delta\left\{\alpha_{N}^{*}(x, \varepsilon)-u_{j}(x, \varepsilon)\right\}+\lambda_{j}(\varepsilon)\left\{\alpha_{N}^{*}(x, \varepsilon)-u_{j}(x, \varepsilon)\right\}= \\
L_{N}(x, \varepsilon)-\left\{\lambda_{j}^{<N>}(\varepsilon)-\lambda_{j}(\varepsilon)\right\} \alpha_{N}^{*}(x, \varepsilon) \text { in } \Omega_{\varepsilon} \\
\left.\left|D^{\alpha}\left\{\alpha_{N}^{*}(x, \varepsilon)-u_{j}(x, \varepsilon)\right\}\right|\right|_{\partial \Omega_{\varepsilon}}=0\left(\varepsilon^{N-1-|\alpha|}\right) \text { for }|\alpha| \leqslant N-1, \\
\Delta\left\{\beta_{N}^{*}(x, \varepsilon)-u_{j+1}(x, \varepsilon)\right\}+\lambda_{j+1}(\varepsilon)\left\{\beta_{N}^{*}(x, \varepsilon)-u_{j+1}(x, \varepsilon)\right\}= \\
\quad M_{N}(x, \varepsilon)-\left\{\lambda_{j+1}^{<N>}(\varepsilon)-\lambda_{j+1}(\varepsilon)\right\} \beta_{N}^{*}(x, \varepsilon) \text { in } \Omega_{\varepsilon} \\
\left.\left|D^{\alpha}\left\{\beta_{N}^{*}(x, \varepsilon)-u_{j+1}(x, \varepsilon)\right\}\right|\right|_{\partial \Omega_{\varepsilon}}=0\left(\varepsilon^{N-1-|\alpha|}\right) \text { for }|\alpha| \leqslant N-1 .
\end{gathered}
$$

From a priori estimates for elliptic boundary value problems we conclude that:

$$
\begin{aligned}
& \max _{X \in \Omega_{\varepsilon}}\left|D^{\alpha}\left\{\alpha_{N}^{*}(x, \varepsilon)-u_{j}(x, \varepsilon)\right\}\right| \leq C \varepsilon^{N-1}|x|^{-|\alpha|} \\
& \max _{X \in \Omega_{\varepsilon}}\left|D^{\alpha}\left\{\beta_{N}^{*}(x, \varepsilon)-u_{j+1}(x, \varepsilon)\right\}\right| \leq C \varepsilon^{N-1}|x|^{-|\alpha|}
\end{aligned}
$$

which completes the proof.

## 4. The final remark

The author of this note think we can study a bifurcations of any eigenvalues by our method under some conditions (for a bifurcation). These conditions are necessary because the bifurcation may be not occured when $\Omega$ is the ball (in general, when $\Omega$ is a domain with some symmetries).
