# 1 Étale cohomology

#### 1.1 From Weil conjectures to *l*-adic cohomology

We began with the question:

Question 1. Given a smooth projective variety  $X/\mathbb{F}_q$ , how many  $\mathbb{F}_{q^n}$ -points does X have for each n? That is, calculate

$$Z(X,t) = \exp\left(\sum_{n=1}^{\infty} |X(\mathbb{F}_{q^n})| \frac{t^n}{n}\right).$$

This lead to the Weil conjectures:

**Theorem 2** (Weil conjectures). If X is a smooth projective variety of dimension d over  $\mathbb{F}_q$ .

- 1. (Rationality) Z(X,t) is a rational function of t, i.e., it is in  $\mathbb{Q}(t) \subseteq \mathbb{Q}((t))$ .
- 2. (Functional equation) There is an integer e such that

$$Z(X, q^{-d}t^{-1}) = \pm q^{ed/2}t^e Z(X, t).$$

3. (Riemann Hypothesis) We can write

$$Z(X,t) = \frac{P_1(t)P_3(t)\dots P_{2d-1}(t)}{P_0(t)P_2(t)\dots P_{2d}(t)}$$

with  $P_i(t) \in \mathbb{Z}[t]$ , and such that the roots of  $P_i(t)$  have absolute value  $q^{-i/2}$ . Moreover,  $P_0(t) = 1 - t$  and  $P_{2d}(t) = 1 - q^d t$ .

4. (Betti numbers) If X comes from a smooth projective variety over  $\mathbb{Z}_{(p)}$ , then

$$\deg P_i(t) = \dim_{\mathbb{Q}} H^i(X(\mathbb{C}), \mathbb{Q}).$$

The strategy was to develop a cohomology theory

$$H^{\bullet}: (\text{Varieties}/k)^{op} \to \text{graded } \mathbb{Q}\text{-vector spaces}$$

for arbitrary varieties, which satisfied the following properties for smooth projective varieties X.

- 1. (Finiteness) dim  $H^{\bullet}(X)$  is finite, and  $H^{i}(X) = 0$  for  $i \notin \{0, 1, \dots, 2 \dim X\}$ .
- 2. (Poincaré Duality) There is a canonical isomorphism  $H^{2\dim X}(X) \cong \mathbb{Q}$ and a natural perfect pairing

$$H^i(X) \times H^{2d-i}(X) \to \mathbb{Q}$$

3. (Lefschetz Trace Formula)

$$|X(\mathbb{F}_{q^m})| = \sum_{i=0}^{2 \dim X} (-1)^i \operatorname{Tr}(\phi_i^m)$$

where  $X_{\overline{\mathbb{F}}_q} = X \times_{\mathbb{F}_q} \overline{\mathbb{F}}_q$ ,  $\phi : X_{\overline{\mathbb{F}}_q} \to X_{\overline{\mathbb{F}}_q}$  is the Frobenius morphism, and  $\phi_i : H^i(X_{\overline{\mathbb{F}}_q}) \to H^i(X_{\overline{\mathbb{F}}_q})$  is the induced morphism.

4. (Compatibility) If  $k = \mathbb{C}$  then  $H^{\bullet}(X)$  is isomorphic to singular cohomology.

Then,

 $\text{Eigenvalues } \alpha_{i,j} \text{ of } \phi_i | H^i(X_{\overline{\mathbb{F}}_q}) \text{ have } |\alpha_{i,j}| = q^{-i/2} \Rightarrow \quad (\text{Riemann Hypothesis})$ 

We saw that:

- 1. (Serre) Due to the existence of supersingular elliptic curves, there cannot be any cohomology theory with the above properties taking values in Qvector spaces.
- 2. For curves, étale cohomology with  $\mathbb{Z}/l^n$ -coefficients has Poincaré Duality and

$$\operatorname{rank}_{\mathbb{Z}/l^n} H^i_{\operatorname{et}}(X_{\overline{\mathbb{F}}_q}, \mathbb{Z}/l^n) = \dim_{\mathbb{Q}} H^i_{\operatorname{sing}}(X(\mathbb{C}), \mathbb{Q})$$

This leads us to define:

$$H^{i}_{\mathsf{et}}(X,\mathbb{Q}_{l}) := \left( \varprojlim_{n \ge 1} H^{i}_{\mathsf{et}}(X,\mathbb{Z}/l^{n}) \right) \otimes_{\mathbb{Z}_{l}} \mathbb{Q}_{l}.$$
(1)

#### 1.2 Successes of *l*-adic cohomology

**Theorem 3.** The  $\mathbb{Q}_l$ -vector spaces  $H^i_{et}(X, \mathbb{Q}_l)$  satisfy (Finiteness), (Poincaré Duality), (Lefschetz Trace Formula), and (Riemann Hypothesis).

We also saw that the  $\mathbb{Z}/l^n$  cohomology groups had a very strong Poincaré Duality formalism.

**Theorem 4.** For any finite type morphism between noetherian schemes  $f : Y \to X$ , and object  $E \in D(X_{et}, \mathbb{Z}/l^n)$  there are adjunctions

$$(f^*, f_*) : D(Y_{\mathsf{et}}, \mathbb{Z}/l^n) \rightleftharpoons D(X_{\mathsf{et}}, \mathbb{Z}/l^n)$$
$$(f_!, f^!) : D(X_{\mathsf{et}}, \mathbb{Z}/l^n) \rightleftharpoons D(Y_{\mathsf{et}}, \mathbb{Z}/l^n)$$
$$(- \otimes E, \underline{\hom}(E, -)) : D(X_{\mathsf{et}}, \mathbb{Z}/l^n) \rightleftharpoons D(X_{\mathsf{et}}, \mathbb{Z}/l^n)$$

satisfying a number of properties such as a Proper Base Change and Smooth Base Change formulas.

In order to have these functors for  $\mathbb{Z}_l$ -sheaves, some work is needed.

**Definition 5** ([BS, Def.3.5.3]). For a scheme X, define  $\mathsf{Shv}_{\mathsf{et}}(X)^{\mathbb{N}}$  to be the category of  $\mathbb{N}$ -indexed projective systems in  $\mathsf{Shv}_{\mathsf{et}}(X)$ . The derived category of this abelian category is denoted by  $D(X_{\mathsf{et}}^{\mathbb{N}})$ .

We write  $D(X_{et}, (\mathbb{Z}_l)_{\bullet}) \subseteq D(X_{et}^{\mathbb{N}})$  for the full subcategory of those objects  $(\cdots \to K_2 \to K_1)$  such that  $K_m \in D(X_{et}, \mathbb{Z}/l^m)$  and  $K_m \otimes_{\mathbb{Z}/l^m} \mathbb{Z}/l^{m-1} \to K_{m-1}$  is a quasi-isomorphism. Here,  $\otimes$  is the left derived tensor product.

**Theorem 6** (Ekedahl). The functors  $f^*, f_*, f_!, f^!, \otimes, \underline{\text{hom}}$  can be extended to the categories  $D(X_{et}, (\mathbb{Z}_l)_{\bullet})$  in a sensible way.

We also had a very nice Galois theory.

**Theorem 7** (Stacks Project, Tags 0BNB, 0BMY,0BN4). Let X be a connected scheme,  $\overline{x} \in X$  a geometric point,  $\text{FEt}_X$  the category of finite étale X-schemes, and consider the functor

$$F: \operatorname{FEt}_X \to \operatorname{Set}; \qquad Y \mapsto |Y_{\overline{x}}|.$$

The étale fundamental group of X is the profinite group

$$\pi_1^{\mathsf{et}}(X,\overline{x}) = \operatorname{Aut}(F)$$

and F induces an equivalence of categories

$$\operatorname{FEt}_X \cong \operatorname{Fin-} \pi_1^{\operatorname{et}}(X, \overline{x}) \operatorname{-Set}$$

with the category of finite sets equipped with a continuous  $\pi_1^{\text{et}}(X, \overline{x})$ -action.

There is also a linear version of this. Recall that  $\text{Loc}_X(R)$  is the category of *local systems* with *R*-coefficients. That is, sheaves *F* of *R*-modules such that for some covering  $\{f_i : U_i \to X\}$ , each  $f_i^*F$  is isomorphic to the constant sheaf  $R^n$  for some *n*. Similar to the case of topological spaces,  $\pi_1$  determines the category of local systems.

**Proposition 8.** If X is a connected locally noetherian  $\mathbb{Z}_{(l)}$ -scheme, then there is an equivalence of categories

$$\mathbb{Q}_{l} \otimes_{\mathbb{Z}_{l}} \varprojlim \operatorname{Loc}_{X}(\mathbb{Z}/l^{n}) \cong \left\{ \begin{array}{c} continuous finite dimensional \\ \mathbb{Q}_{l} \text{-linear representations of } \pi_{1}^{et}(X) \end{array} \right\}$$

### 1.3 Shortcomings of *l*-adic cohomology

All of this is not quite as nice as it could be though.

#### Problem 9.

1. The definition  $H^i_{\mathsf{et}}(X, \mathbb{Q}_l) := \left( \varprojlim_{n \ge 1} H^i_{\mathsf{et}}(X, \mathbb{Z}/l^n) \right) \otimes_{\mathbb{Z}_l} \mathbb{Q}_l$  is a d hoc, and not very pleasant to work with.

- 2. The categories  $D(X_{et}, (\mathbb{Z}_l)_{\bullet})$  are horrible to work with.
- 3. The equivalence between local systems and  $\pi_1$ -representations is no longer true in general if one uses, honest  $\mathbb{Q}_l$ -local systems.

**Question 10.** So why can't we just use sheaves of  $\mathbb{Z}_l$ -coefficients?

Representability!

Finite coefficients work so well due to the equivalence of categories.

**Theorem 11.** There is equivalence of categories

 $\operatorname{FEt}(X) \cong \operatorname{Loc}_X(\operatorname{FinSet})$ 

between the category of finite étale X-schemes and the category of locally constant étale sheaves.

This suggests that we should enlarge the category Et(X) to include filtered limits.

# 2 Pro-étale schemes

**Definition 12.** A morphism  $\operatorname{Spec}(B) \to \operatorname{Spec}(A)$  of affine schemes is pro-étale if there exists a cofiltered<sup>1</sup> system  $(B_{\lambda})_{\lambda \in \Lambda}$  of étale finite presentation A-algebras such that  $B = \varinjlim B_{\lambda}$ . The system  $(B_{\lambda})$  is called a presentation for B.

**Exercise 1.** Let  $(B_{\lambda})_{\lambda \in \Lambda}$  be a cofiltered system of rings. Let Primes(C) denote the set of prime ideals of a ring C, and Spc(C) the underlying topological space of Spec(C), i.e., Spc(C) is Primes(C) equipped with its Zariski topology.

- 1. Show that  $\operatorname{Primes}(\lim B) = \lim \operatorname{Primes}(B_{\lambda})$ .
- 2. Show that for any  $f \in B_{\lambda}$  with image  $\overline{f} \in \varinjlim B_{\lambda}$ , the set  $D(\overline{f}) \subseteq$ Primes $(\varinjlim B_{\lambda})$  of primes not containing  $\overline{f}$  is the preimage of the set  $D(f) \subseteq \overrightarrow{\text{Primes}}(B_{\lambda})$  of primes not containing f, under the canonical map  $\pi$ : Primes $(\varinjlim B_{\lambda}) \rightarrow \operatorname{Primes}(B_{\lambda})$ . That is, show  $D(\overline{f}) = \pi^{-1}(D(f))$ .
- 3. Deduce that  $\operatorname{Spc}(\lim B_{\lambda}) = \lim \operatorname{Spc}(B_{\lambda})$ .

**Exercise 2.** Let k be an algebraically closed field. Using Exercise 1, show that for every pro-finite set S, there exists a pro-étale k-scheme  $\operatorname{Spec}(B) \to \operatorname{Spec}(k)$  with  $S \cong \operatorname{Spc}(B)$ .

**Exercise 3.** Let k be a field and  $k \subseteq k^{sep}$  a separable closure. Show that the  $\operatorname{Spec}(k^{sep}) \to \operatorname{Spec}(k)$  is pro-étale.

<sup>&</sup>lt;sup>1</sup>A system is cofiltered if (i) it is nonempty, (ii) for every pair of objects  $B_{\lambda}, B_{\lambda'}$  there is a third object  $B_{\lambda''}$  and morphisms in the system  $B_{\lambda} \to B_{\lambda''}, B_{\lambda'} \to B_{\lambda''}$ , and (iii) for any pair of parallel morphisms in the system  $B_{\lambda} \rightrightarrows B_{\lambda'}$  there exists a morphism in the system  $B_{\lambda'} \to B_{\lambda''}$  such that the two compositions are equal.

**Exercise 4.** Suppose that  $\operatorname{Spec}(B) \to \operatorname{Spec}(A)$ ,  $\operatorname{Spec}(C) \to \operatorname{Spec}(A)$  are proétale with  $B = \varinjlim_{\lambda \in \Lambda} B_{\lambda}$  and  $C = \varinjlim_{\mu \in M} C_{\mu}$  presentations. Show that  $\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} \operatorname{Spec}(C) \to \operatorname{Spec}(A)$  is pro-étale. Hint: consider the system  $(B_{\lambda} \otimes_A C_{\mu})_{(\lambda,\mu) \in \Lambda \times M}$ .

**Exercise 5.** Recall that if L/k is a (finite) Galois extension, then  $\operatorname{Spec}(L \otimes_k L) \cong \prod_{Gal(L/k)} \operatorname{Spec}(L)$ . Recall also that an separable closure  $k^{sep}/k$  is the union of the finite Galois subextensions  $k \subseteq L \subseteq k^{sep}$  and  $Gal(k^{sep}/k) \cong \lim_{k \in L \subseteq k^{sep}} Gal(L/k)$ . Show that

$$\operatorname{Spc}(k^{sep} \otimes_k k^{sep}) \cong \operatorname{Gal}(k^{sep}/k)$$

as topological spaces.

**Exercise 6.** Let A be a ring and  $\mathfrak{p} \in \operatorname{Spec}(A)$  a point. Show that the canonical morphism  $\operatorname{Spec}(A_{\mathfrak{p}}) \to \operatorname{Spec}(A)$  is pro-étale.

**Example 13.** Let  $p_n$  be the *n*th prime number (so  $p_1 = 2, p_2 = 3, p_3 = 5, p_4 = 7, p_5 = 11, p_6 = 13, p_7 = 17, ...$ ). For any  $n \in \mathbb{N}$ , the map

$$X_n := \operatorname{Spec}(\mathbb{Z}[\frac{1}{p_1}, \dots, \frac{1}{p_n}]) \amalg (\sqcup_{i=1}^n \operatorname{Spec}(\mathbb{Z}_{(p_i)})) \to \operatorname{Spec}(\mathbb{Z})$$

is pro-étale. Moreover, there are canonical morphisms  $X_{n+1} \to X_n$  induced by the canonical pro-étale morphisms

$$\operatorname{Spec}(\mathbb{Z}[\frac{1}{p_1},\ldots,\frac{1}{p_n},\frac{1}{p_{n+1}}]) \amalg \operatorname{Spec}(\mathbb{Z}_{p_{n+1}}) \to \operatorname{Spec}(\mathbb{Z}[\frac{1}{p_1},\ldots,\frac{1}{p_n}])$$

Consequently,  $X := \lim_{n \to \infty} X_n$  is a pro-étale  $\operatorname{Spec}(\mathbb{Z})$  scheme. As a set, we have

$$X = \{\eta\} \amalg (\sqcup_{n \ge 1} \{\eta_i, \mathfrak{p}_i\})$$

where  $\{\eta_i, \mathfrak{p}_i\}$  correspond to the points of  $\operatorname{Spec}(\mathbb{Z}_{(p_i)})$ , and  $\eta$  corresponds to the generic points of the  $\operatorname{Spec}(\mathbb{Z}[\frac{1}{p_1}, \ldots, \frac{1}{p_n}])$ 's. The open sets of X are disjoint unions of sets of the form

$$\{\eta_i\}, \qquad \{\eta_i, \mathfrak{p}_i\}, \qquad X\setminus (\sqcup_{i=1}^N\{\eta_i, \mathfrak{p}_i\}).$$

In particular, every open covering of X can be refined by one which is a finite family of sets of the above form. These sets' corresponding rings of functions are

$$\mathbb{Q}, \qquad \mathbb{Z}_{(p_i)}, \qquad \lim_{n \to \infty} \mathbb{Z}[\frac{1}{p_1}, \dots, \frac{1}{p_n}] \times (\mathbb{Z}_{(p_N)} \times \mathbb{Z}_{(p_{N+1})} \times \dots \times \mathbb{Z}_{(p_n)}).$$

The latter is a subring of  $\prod_{i>N} \mathbb{Z}_{(p_i)}$  with  $\mathbb{Z}[\frac{1}{p_1}, \ldots, \frac{1}{p_n}]$  embedded diagonally into  $\prod_{i>n} \mathbb{Z}_{(p_i)}$ . Here is a picture.

$$\eta \stackrel{\dots \eta_4}{\stackrel{\eta_3}{\bullet}} \eta \stackrel{\eta_2}{\stackrel{\circ}{\circ}} 0^{\gamma_1} \quad \left\{ \begin{array}{c} \eta_1 \\ 0 \end{array} \right\} \text{open points} \\ \bullet \\ \vdots \\ \mathfrak{p}_4 \end{array}$$

**Exercise 7.** Consider the X from Example 13. Show that for every open covering  $\{U_i \to X\}_{i \in I}$  the associated morphism  $\coprod U_i \to X$  admits a section.

## 3 The pro-étale topology

The property in the above example is extremely important.

**Definition 14.** An object in a site is weakly contractible if for every covering  $\{U_i \to X\}$  the morphism  $\amalg U_i \to X$  admits a section.

#### Example 15.

- 1. Strictly hensel rings are weakly contractible with respect to étale coverings.
- 2. The scheme Spec(B) constructed in Exercise 2 is weakly contractible with respect to étale coverings (use the fact that any étale covering of  $\text{Spec}(\lim B_{\lambda})$  is the base change of an étale covering of some  $B_{\lambda}$ ).
- 3. The scheme X constructed in Example 13 is weakly contractible with respect to Zariski coverings, but not étale coverings, since none of the residue fields are separably closed.

**Lemma 16.** If X is a weakly contractible object, then  $H^n(X, F) = 0$  for all i and all F. More interestingly, the evaluation at X functor  $Shv(C, Ab) \rightarrow Ab$  is exact.

*Proof.* To calculate cohomology we choose an injective resolution (or fibrant replacement)  $F \to I^{\bullet}$ . By definition, the cohomology sheaves  $a\underline{H}^n(-, I^{\bullet})$  are zero for n > 0. This means that for every  $s \in H^n(X, F)$ , there exists a covering  $\{U_i \to X\}$  such that  $s|_{U_i} = 0$  for all i. But every covering of X admits a section, and there fore s = 0.

Suppose  $0 \to F \to G \to H \to 0$  is a short exact sequence. Evaluation on an object is left exact, so it suffices to show that  $G(X) \to H(X)$  is surjective. By definition of a surjective morphism of sheaves, for every  $s \in H(X)$  there is a covering  $\{U_i \to X\}$  such that for each *i* the section  $s|_{U_i}$  is in the image of  $G(U_i) \to H(U_i)$ . But  $\amalg U_i \to X$  admits a section, so  $s \in H(X)$  is in the image of  $G(X) \to H(X)$ .

**Definition 17.** A site is locally weakly contractible if every object admits a covering by weakly contractible objects.

**Proposition 18.** If C is a locally weakly contractible site, then for any system  $(\dots \to F_2 \to F_1)$  of surjective morphisms of sheaves,  $R \lim_{n \in \mathbb{N}} F_n = \lim_{n \in \mathbb{N}} F_n$ .

It turns out that if we add pro-étale morphisms to Et(X), then the new bigger site is locally weakly contractible. Limits are so nice in this new site that it fixes the problems described above.

**Theorem 19.** Let X be a connected noetherian scheme.

1. We have

$$H^i(X_{\mathsf{proet}}, \mathbb{Q}_l) \cong H^i(X_{\mathsf{et}}, \mathbb{Q}_l)$$

where the right hand side is the limit Eq.(1), and the left hand side is honest sheaf cohomology  $\mathbb{Z}_l$ .

- 2. The six functors of Theorem 4 work for the honest derived categories  $D(X_{\text{proet}}, \mathbb{Z}_l)$ .
- 3. If X = Spec(k) is the spectrum of a field, then the subcategory of quasicompact quasiseparated objects  $X_{\text{proet}}^{qcqs}$  is canonically isomorphic to the category of profinite continuous (not necessarily finite)  $\text{Gal}(k^{sep}/k)$ -sets

 $\operatorname{Spec}(k)_{\operatorname{proet}}^{qcqs} \cong \operatorname{Pro-Fin-Gal}(k^{sep}/k)\operatorname{-Set}.$ 

4. Honest  $\mathbb{Q}_l$ -local systems on X are equivalent to continuous representations of  $\pi_1^{\text{proet}}(X)$  on finite dimensional  $\mathbb{Q}_l$ -vector spaces.
